email: richard.zarda@lmco.com)*

<https://embastion.external.lmco.com/methods-group/wde>

Presented June 12-13th, 2000, at the NIST ITEM2000 Conference in Gaithersburg, Md

Basic efforts:

- Development of a Web-based Design Environment (WDE) that can be used (both by the DoD and commercial companies) in multidisciplinary, distributed, collaborative design activities throughout the world-wide-web.
- Application and demonstration of the use of WDE for performing both Conceptual Missile Design (IMD – Interactive Missile Design) and Conceptual Fire Control Design (IGD – Interactive Gimbal Design) at Lockheed Martin Missiles & Fire Control (LMM&FC).

Leverage:

- WDE will build upon and hence leverage significant investments already made in a product, AML, an Adaptive Modeling Language, offered commercially by TechnoSoft. The WDE incorporation of IMD and IGD, presently developed in AML, will build upon and also leverage significant investments made by the DARPA RaDEO-IGD Program, AM**3 and LMM&FC.

Overview of AML (Adaptive Modeling Language)

- AML provides an object oriented engineering framework to capture and organize the vital engineering knowledge and processes within a unified object-oriented part model.
- AML's underlying virtual layer architecture enables the seamless integration of engineering tools to automate the entire engineering cycle from conceptual design to production.

Domain knowledge

- Knowledge related to the product and process design as used within the various disciplines.

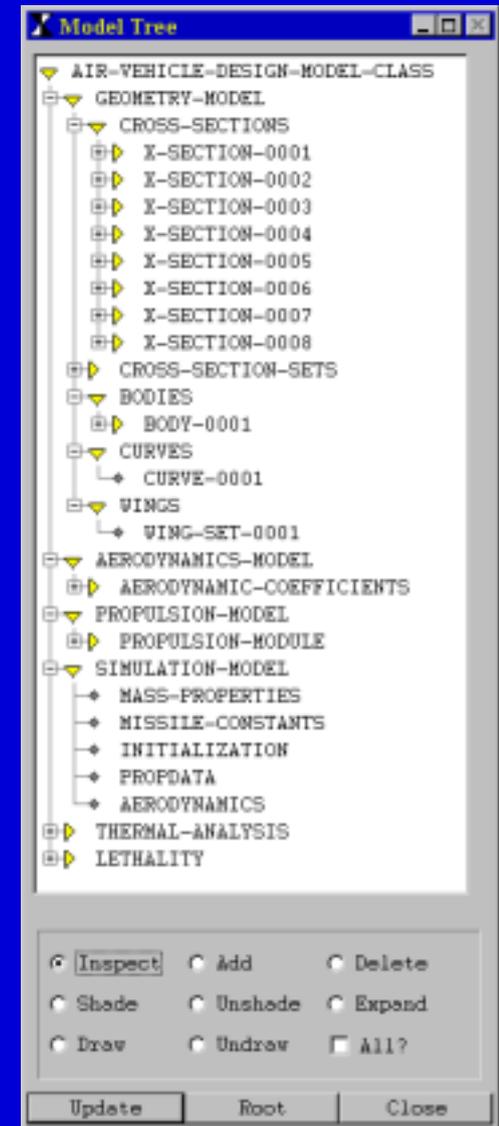

Application knowledge

- Knowledge related to the use of the various engineering tools as applied to the product and process design.

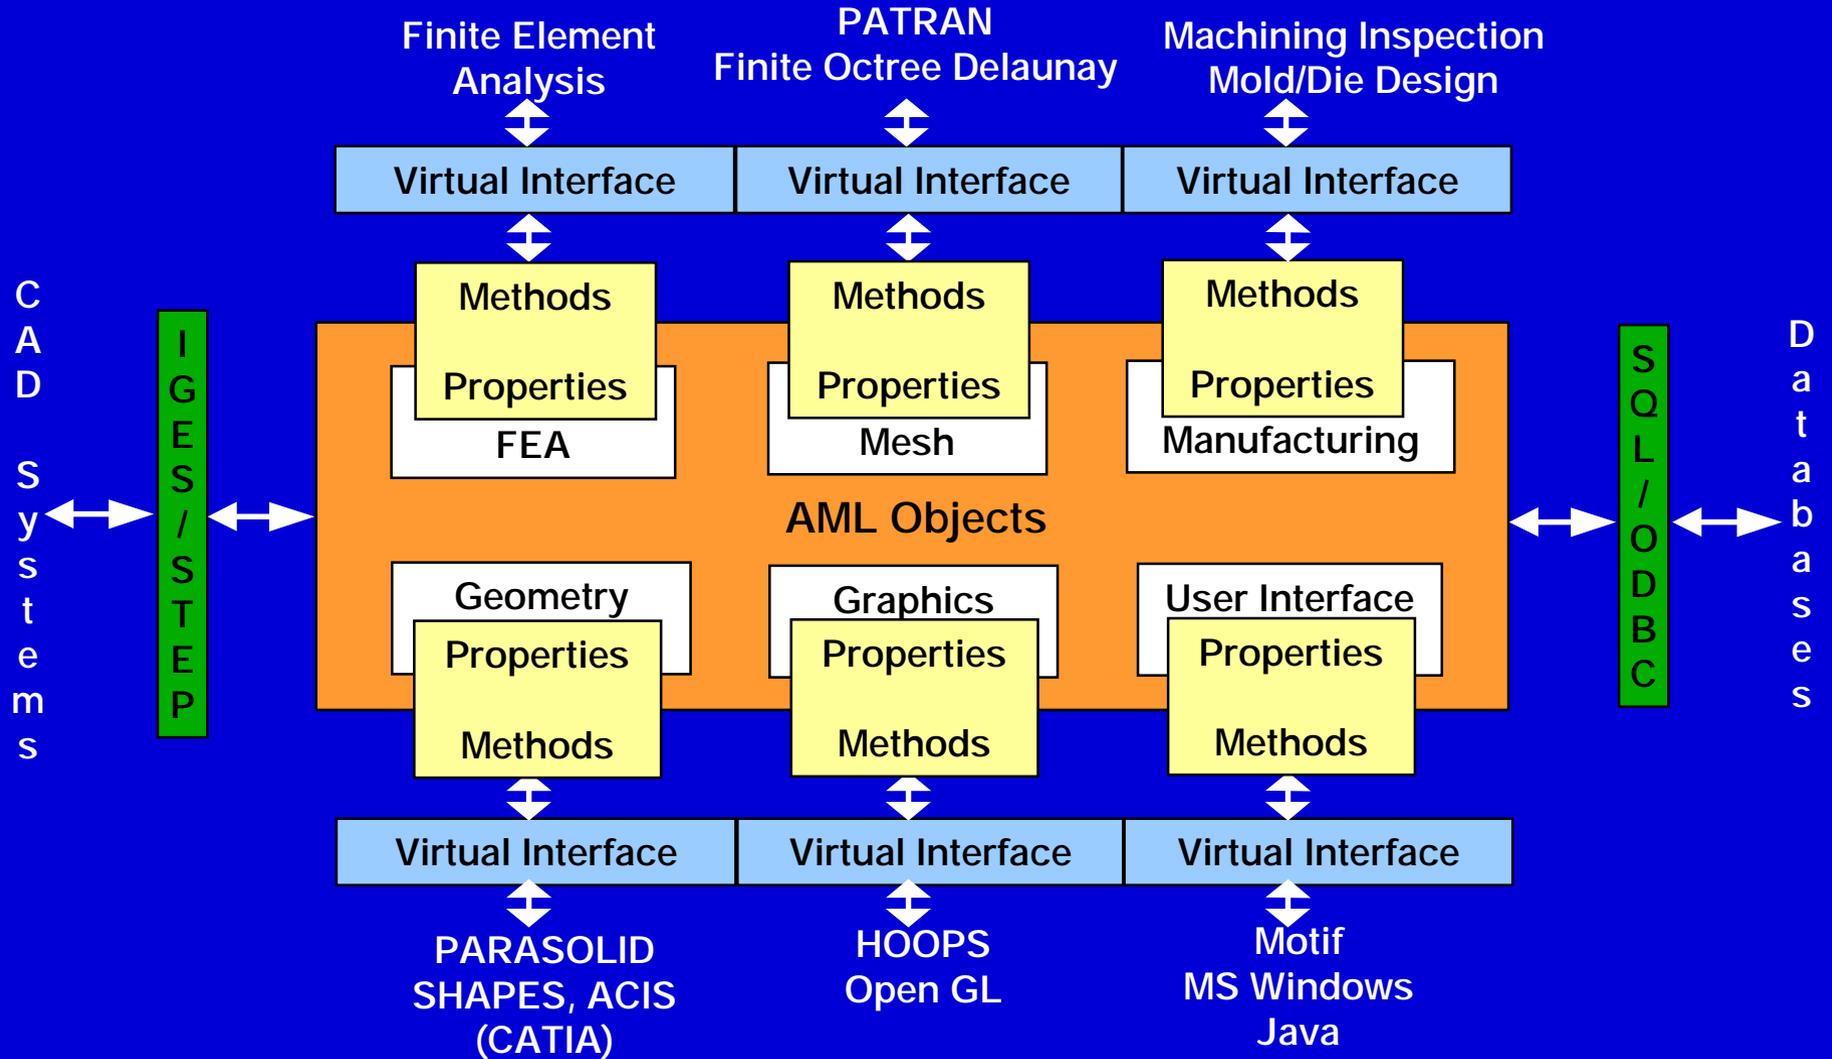

The AML's framework enables engineers from various disciplines (design, analysis, and process planning...) to simultaneously interact in a dynamic environment supporting concurrent and collaborative engineering.

Distributed Dynamic Models & Dependency Tracking

- Models, Objects, and Properties can be dynamically added and/or edited independent of the order of dependency.
- Forward and backward dependencies at any level are automatic.
- Models, Objects, and Properties are dynamically managed across distributed sites amongst concurrent/non-current users.
- When a Model, Object or Property is changed, all dependent Models, Properties, and Objects are notified. These are recomputed only when demanded.
- The AML part model is divided into sub-models each of which captures the strategy of one's engineering discipline.

AML's General System Architecture

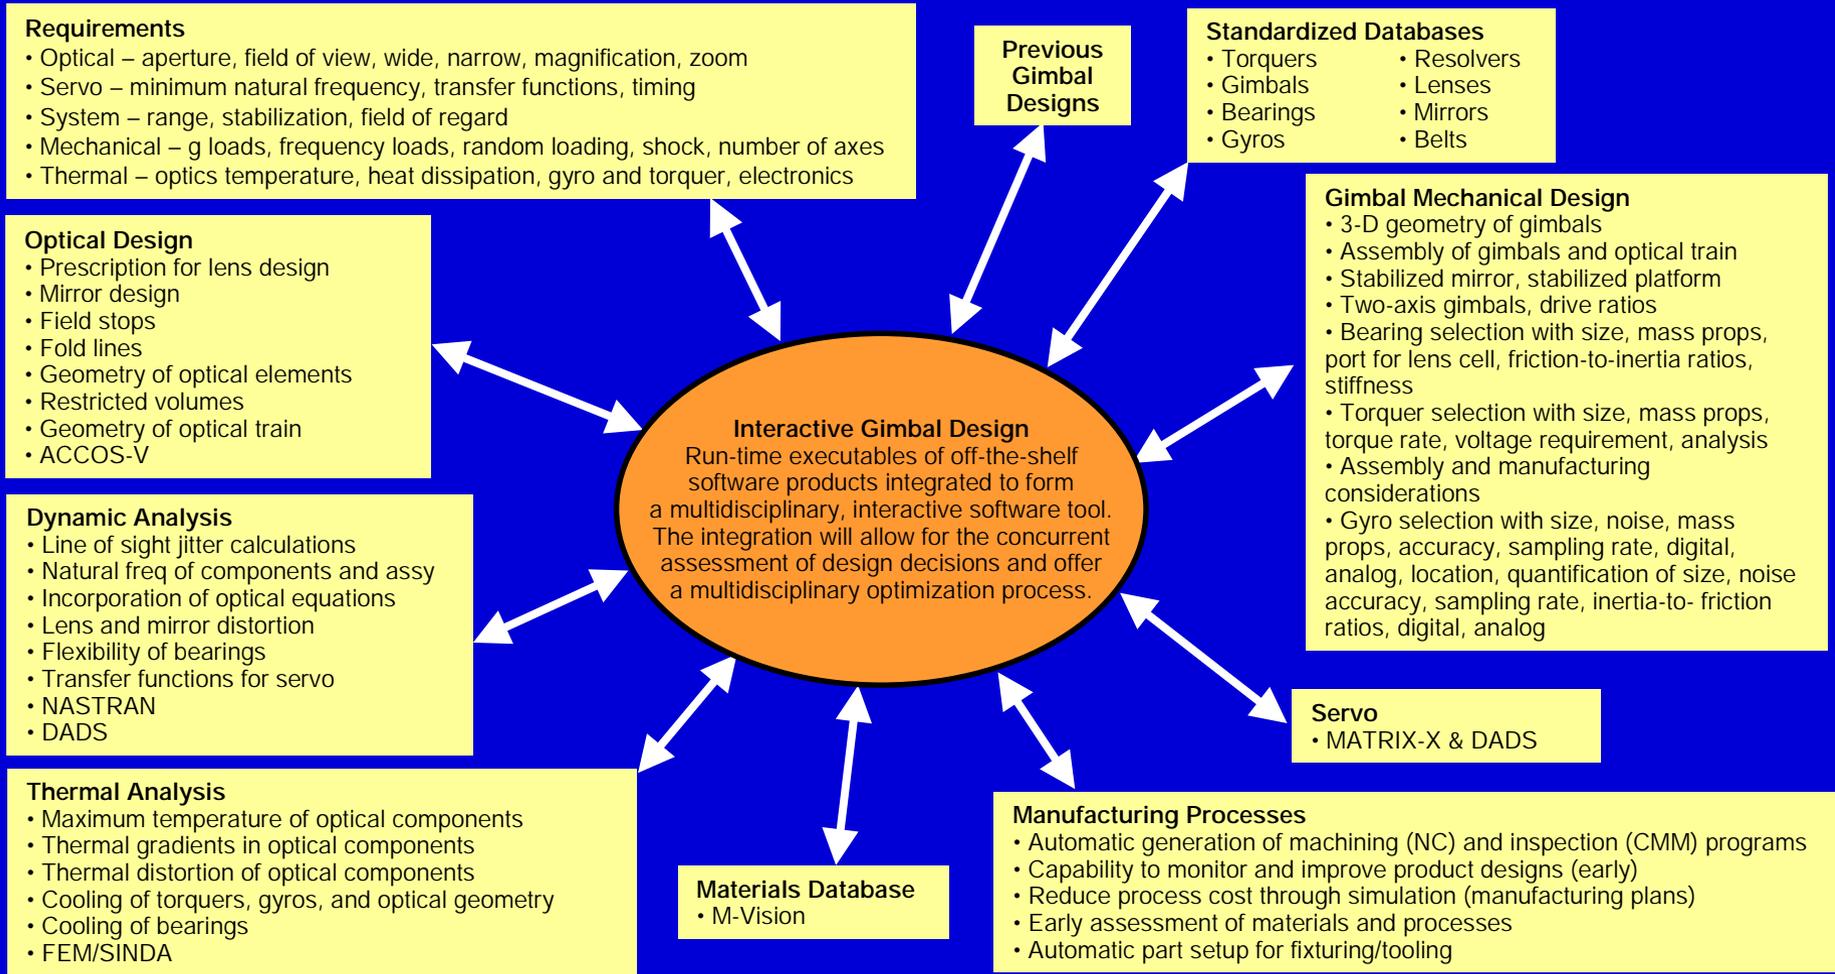

Overview of WDE Functionality

- Object-Oriented Modeling
- AML Framework Architecture for WDE
- Modular Architecture of WDE
- Virtual Layer Architecture of WDE
- Distributed Models of WDE
- Multi Users, Single Unified Model of WDE
- Event Triggers and Event Manager of WDE
- Dependency Tracking and Demand Driven Computation of WDE
- Model Querying of WDE
- Security of WDE
- Conflict Resolution, Optimization, Sensitivity Studies of WDE
- Scalability of WDE
- Large Data Models of WDE
- WDE Activity Based Cost Modeling
- Integrating New Design Tools in WDE
- Design Process Capture of WDE
- Automatic Documentation of WDE
- WDE integration with SAVE, SBD, CORBA, DCOM

```

Web-enabled Interactive Missile Design (IMD)

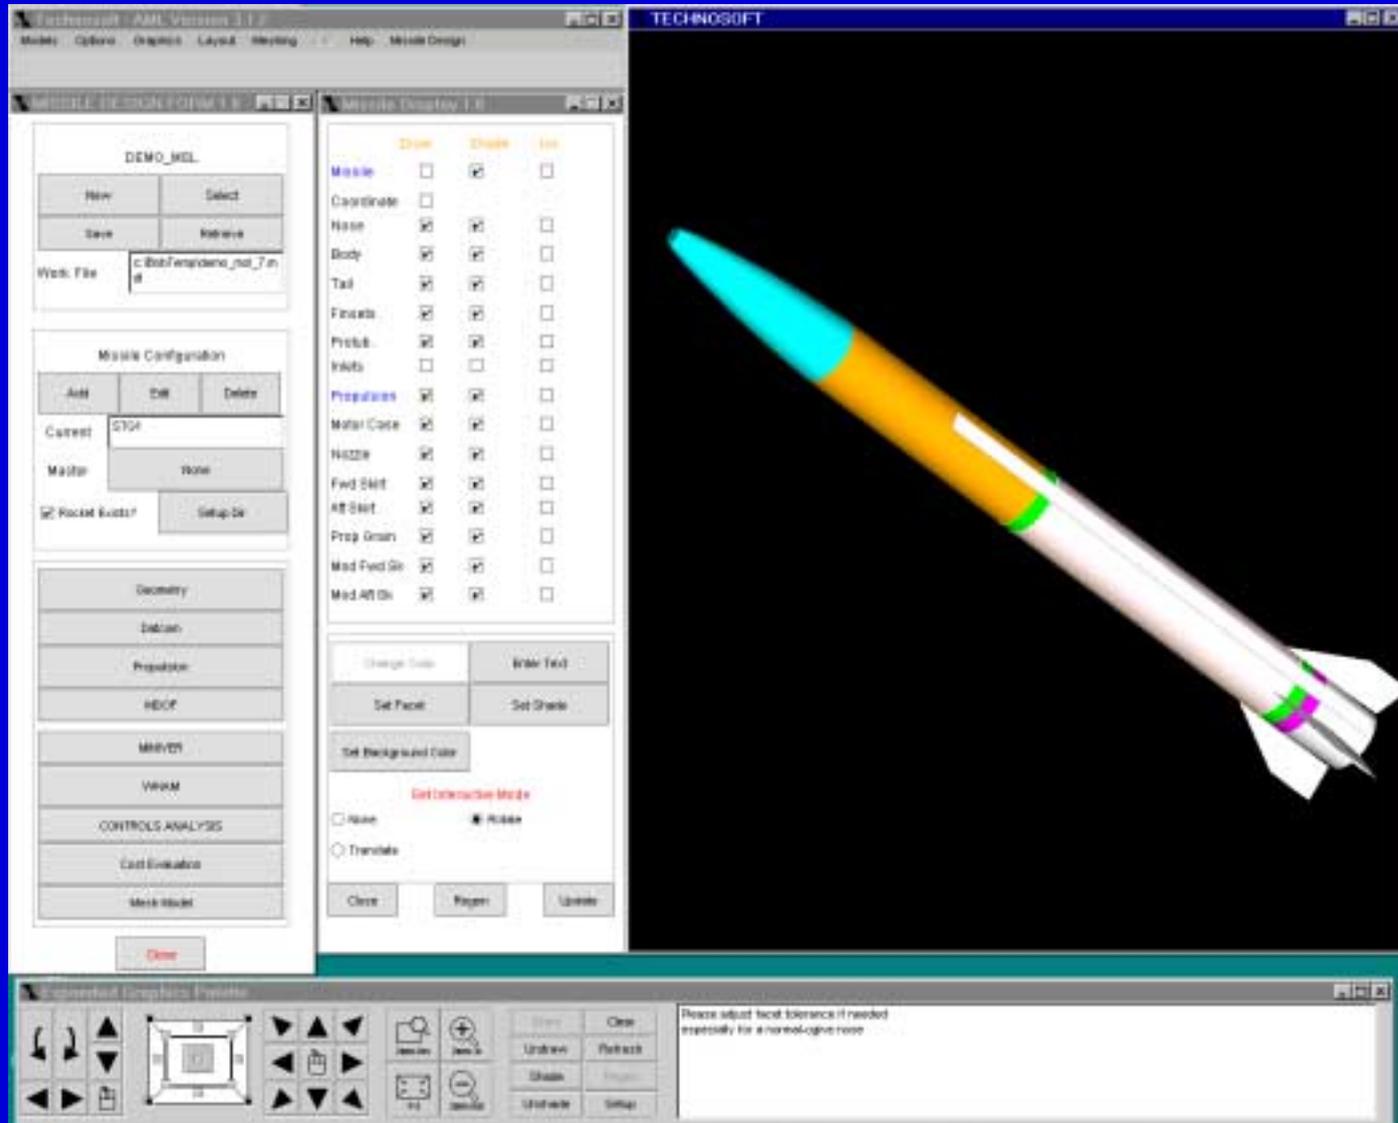

Features:

- External geometry
- Vehicle Aerodynamics
- Propulsion Analysis
- 3 – 6 DOF Simulation
- Controls Analysis
- Aero-thermal Heating Analysis
- Blast Frag Warhead Lethality Analysis
- Airframe Structural / Dynamic Analysis

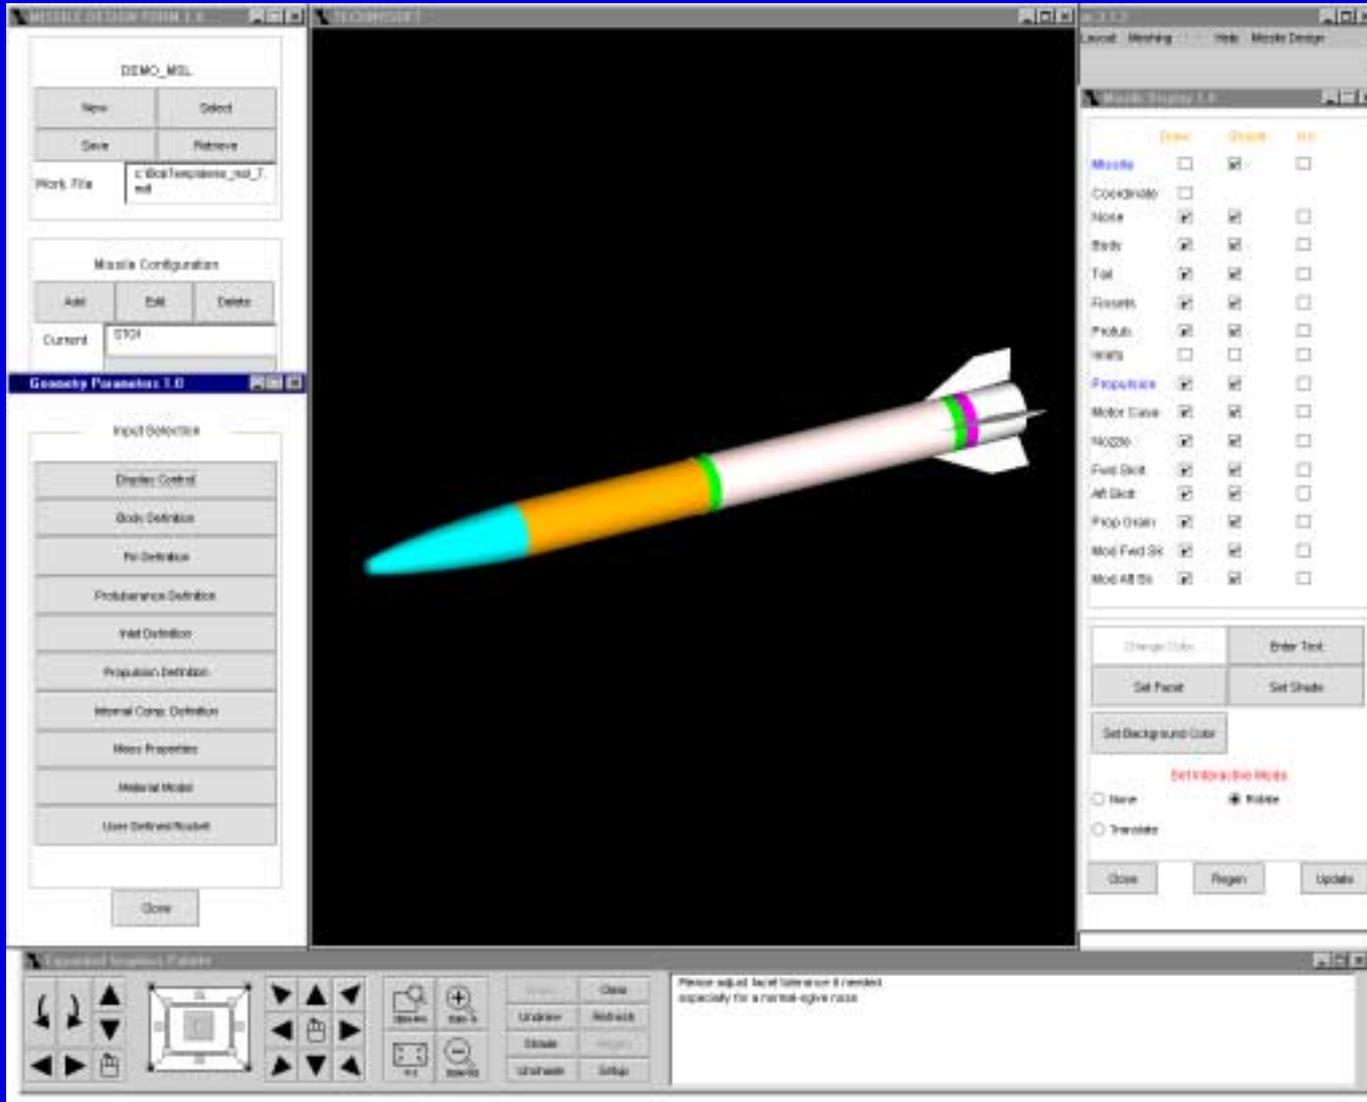

Demonstration:

- Two client, collaborative session with common model
- Real-time access design changes (missile nose & propulsion system)
- Simultaneous, dual model, real-time collaborative session

Client 1 loads missile model

Client 2 also loads same model

Client 2 makes a DATCOM run and displays Ca coefficients

Thin-Lens Example

Web-enabled "Thin-Lens" Design Tool

Features:

- Thin-Lens Physics (Lens-Power, Refraction, Paraxial Rays)
- Lens, Folds, Mirrors, Aperture-Stops, Target Surfaces
- Automatic Optical-Axis (unfolded or folded)
- Automatic Chief-Ray, Axial-Ray
- Merdional Ray Traces
- Thick-Lens Recipes
- LENO file output

Demonstration:

- 2-Client, Collaborative session, Common-model
- Real-time access design change (placement of fold-mirror)
- Maintain focus-point alignment with reference-plane.
- Resultant robust design, with thick-lens LENO output.

Original Design (unfolded & folded)

Modified Design (thick-lens, LENO output)

The screenshot displays the Technosoft AML software interface. The main window shows a 3D model of a thick-lens optical system with green rays being traced through it. The interface includes a menu bar (MODELS, OPTIONS, GRAPHICS, LAYOUT, MESSAGES, EDIT, HELP), a toolbar, and several panels:

- Thin Lens Design Panel:** Shows design parameters for 'design-0001', including a list of elements and buttons for Add, Edit, Delete, Unfold, Draw, Controls, Ray Tracing, Reports, and Done.
- LENO FILE: DESIGN-0001 Panel:** Displays the LENO output text, which includes lens specifications and ray tracing data.
- Expanded Graphics Palette:** Located at the bottom, it contains various navigation and rendering tools like Draw, Clear, Undraw, Refresh, Shade, Regen, Unshade, and Setup.

The LENO output text is as follows:

```

Overview of Propellant Burn Simulations (to be integrated into IMD/WDE)

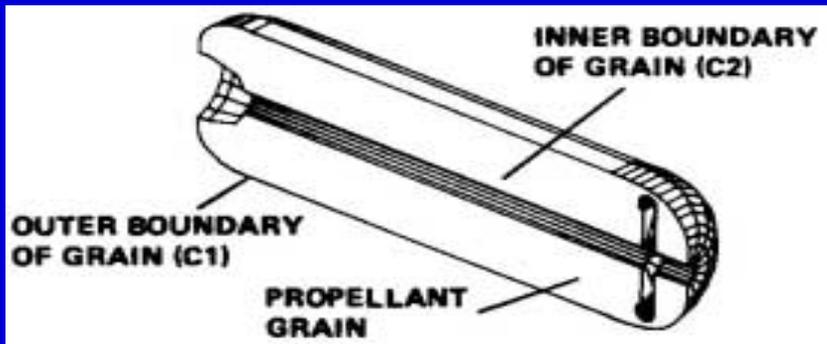

Objective:

- Create a propulsion burn analysis utility using AML
- Integrate burn analysis into IMD-WDE.

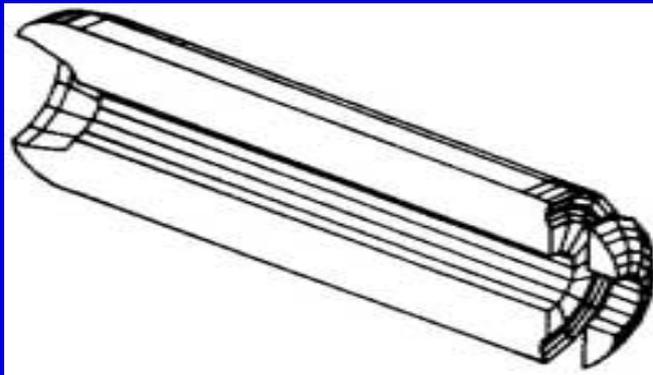

Features:

- Burn Area
- Burn Volume
- Moments of inertia
- Motion of center of gravity (as a function of burn distance)

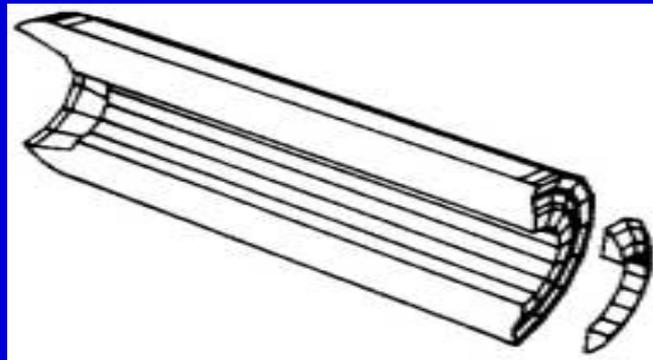

Propellant-grain (cross-sections)

1. Initial Propellant grain

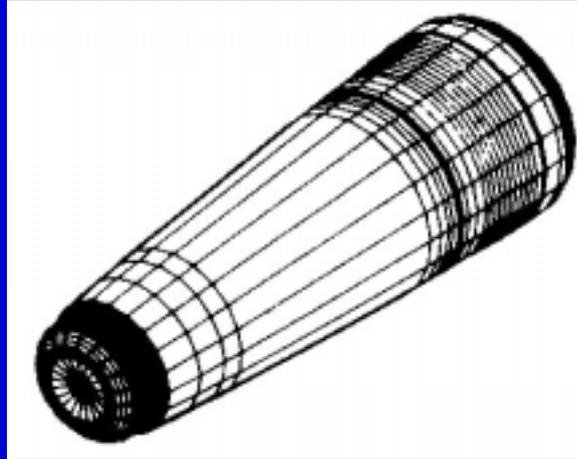

2. Propellant burn after it has grown an amount $1D$ normal to itself

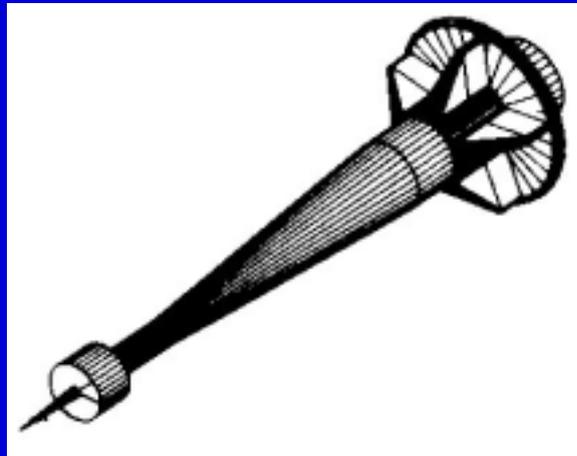

3. Propellant burn after it has grown an amount $2D$ normal to itself

Burn-boundary diagrams

1. Outer boundary

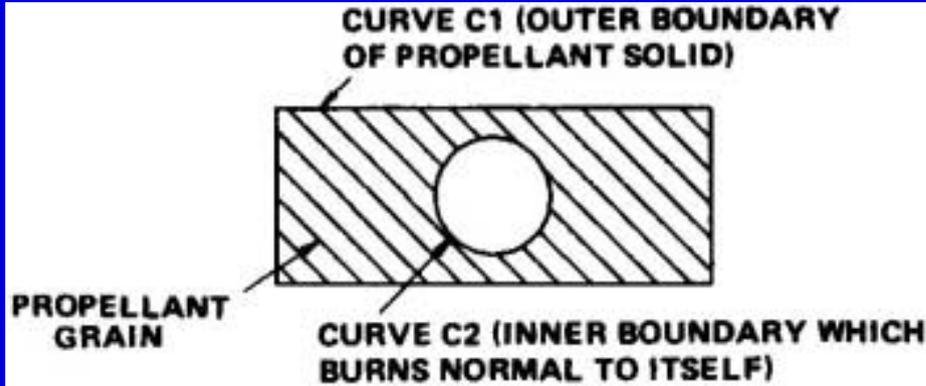

2. Inner boundary

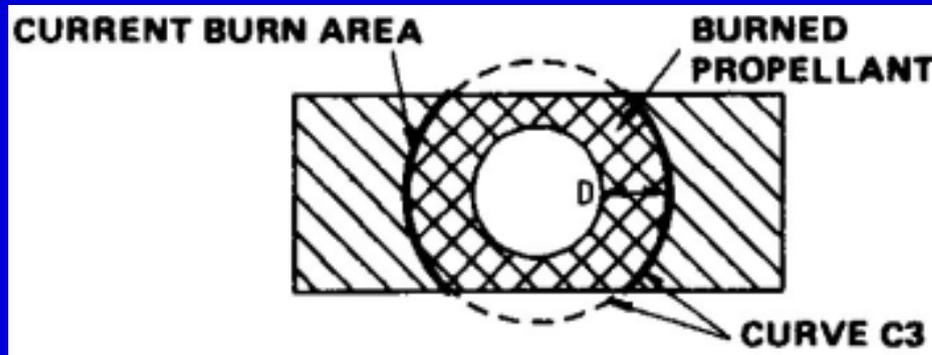

3. Blowup of the star region

Area of Burn

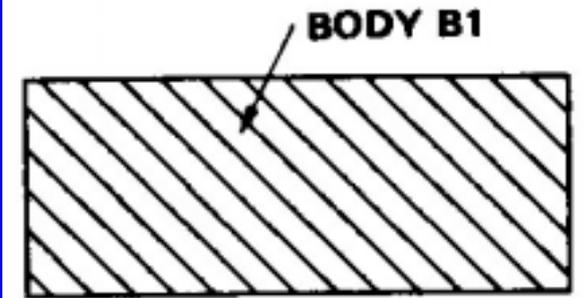

1. Initial Geometry of propellant

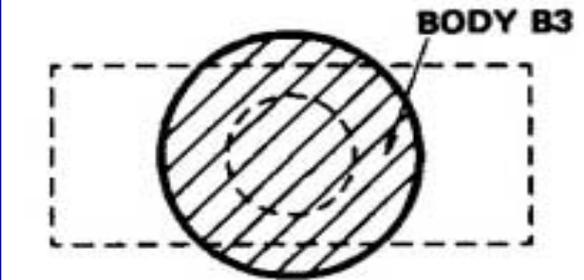

2. Geometry of propellant after initial burn surface has burned normal to itself an amount D

$$\text{AREA of BURN} = \frac{A_{B3} + A_{B4} - A_{B5}}{2}$$

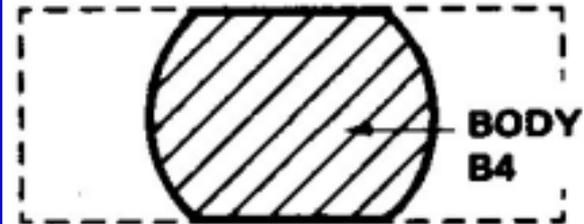

3.

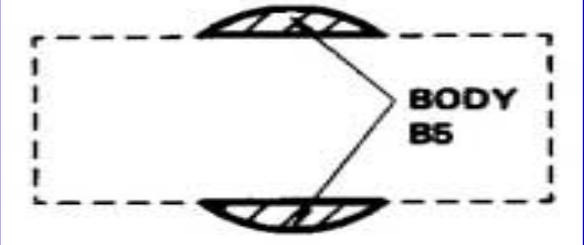

4.

5.

6.

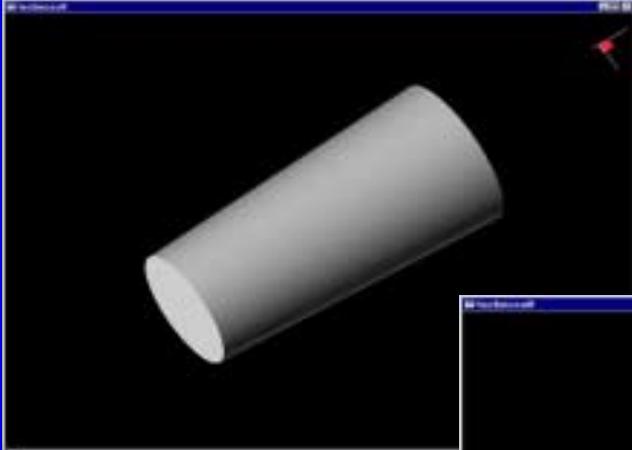

Burn-boundary modeling procedure

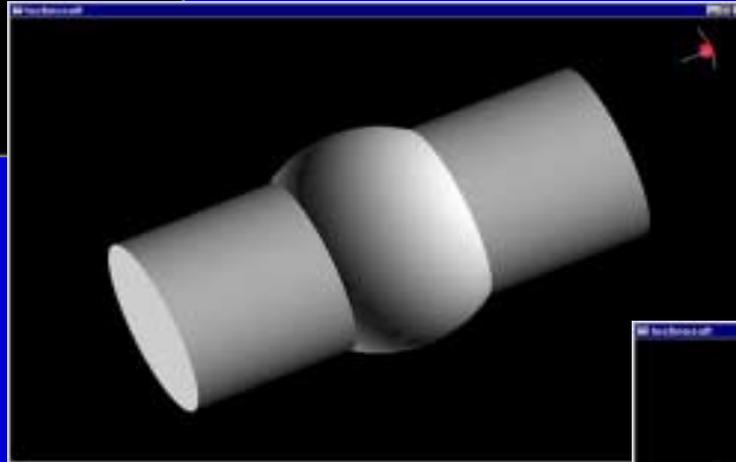

1. Input sub-objects to define outer and inner boundary's of the propellant grain geometry object. The inner boundary sub-object has a parameter for burn distance (normal to surface). Sub-object inherits one of four growth schemes.
2. During simulation, parts of the inner boundary will start to grow beyond the outer boundary, thus use intersection control to get the real shape of the space inside the propellant grain.
3. Get the Shell objects. In order to get the burn surface area, determine the inner boundary shell object and the outer boundary shell object. Then determine the surface area of the space inside the propellant burn.
4. Intersect the surfaces. When the propellant has grown enough, some of the container surfaces are exposed. Those should not be counted in. By intersecting the surface (shell) of the inner space object with the container (outer boundary) determine the exposed container surfaces.
5. Calculate the area as the difference between the inner space area and the exposed container area.

Burn-boundary AML models

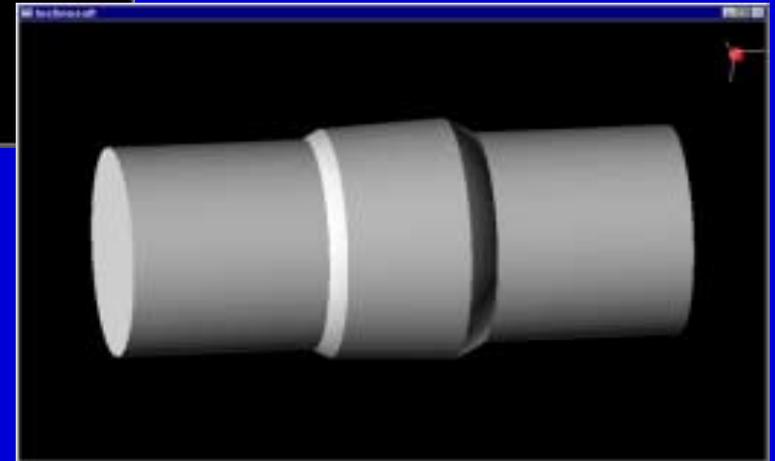

Outer Boundary (truncated cone)

Inner boundary (sample)

Inner boundary after growing.
Note: Inner boundary growth is limited by outer boundary.

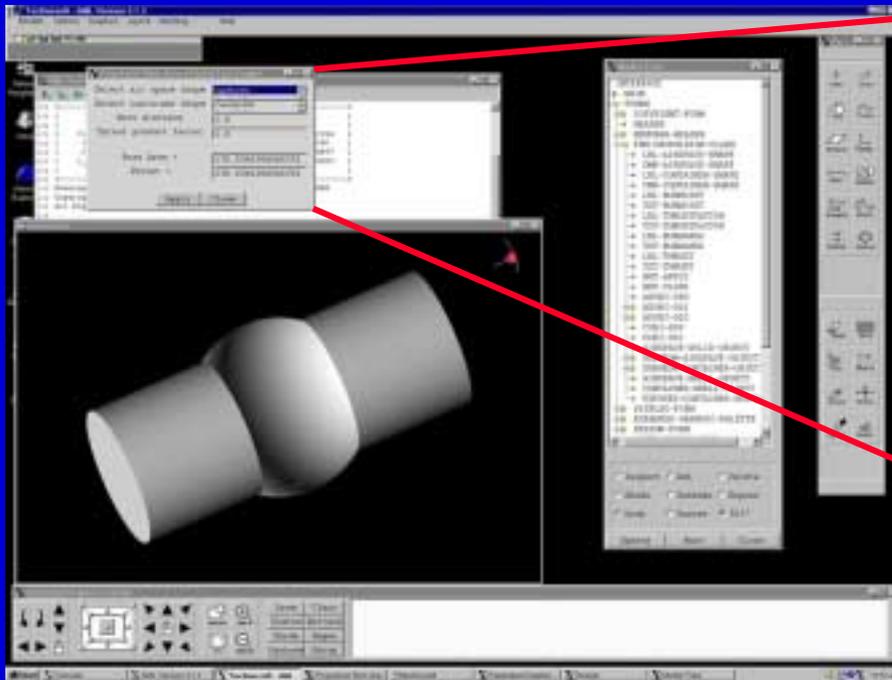

Propulsion Burn AML User Interface

The user interface allows the user to specify parameters such as

- The inner boundary geometry (from an existing list)
- The outer boundary geometry (from an existing list)
- The burn distance
- The thrust product factor

The user interface allow the user to see the results directly. The surface area and thrust is automatically determined.

Propulsion Burn Area of Solid Fuel Engine

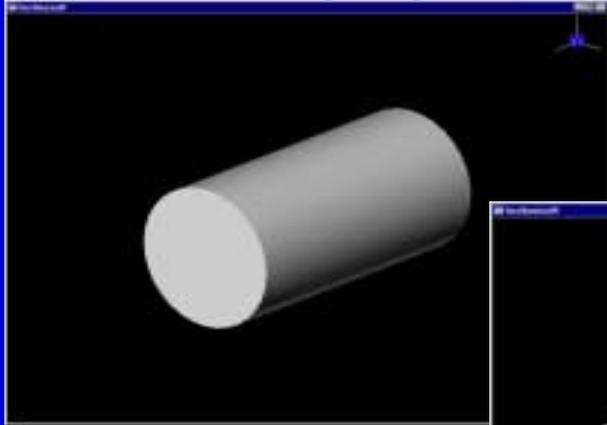

Select air space shape	CapObj001
Select container shape	ContObj000
Burn distance	1.0
Thrust product factor	1.0
Burn Area =	135.0386386066391
Thrust =	135.0386386066391

Apply Close

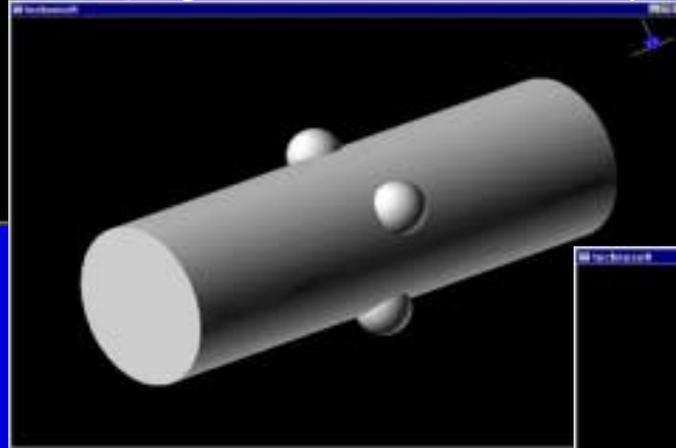

Propulsion Burn Geometry Library

The user should be able to select an inner and outer geometry objects from a wide range of commonly used geometry, both simple and complex objects.
